- 1. Greenpeace Forms unit for "Green" Technology
- 2. Florida Man Pleads Guilty to CFC Smuggling
- 3. Four Convicted in Louisiana Methyl Bromide Case That Killed Mother and Sickened Child
- 4. Modine Displays CO₂ Air-Conditioning System at SAE Automotive Alternative Refrigerant Systems Symposium

1. Greenpeace Forms unit for "Green" Technology

NETHERLANDS, AMSTERDAM - August 11, 2000, The environmental group Greenpeace said yesterday that it was forming a unit to spur the creation of "green" technologies.

"The objective of the unit is to influence the development of technology towards sustainable solutions and promote their entry into the market," Greenpeace Executive Director Thilo Bode said in a statement.

The move follows the organisation's work in devising environmental guidelines for the Sydney Olympics.

Greenpeace said it had convinced Olympic sponsor Coca Cola to replace their refrigerants with "Greenfreeze" technology in their worldwide operations. Greenpeace developed "Greenfreeze", which uses hydrocarbon gases such as propane instead of hydrochlorofluorocarbons (HCFCs) and hydrofluorocarbons (HFCs), identified as causing depletion of the ozone layer and global warming.

Scientists say too much carbon dioxide and other gases create a greenhouse effect which is raising world temperatures.

The organisation, with its global headquarters in Amsterdam, said it will build on previous work on technology and appoint the system analyst and physicist Harry Lehmann to head the new unit.

Lehmann is the former director of the Wuppertal Institute, a German environmental research organisation.

2. Florida Man Pleads Guilty to CFC Smuggling

Burt A. Ammons, of Stuart, Fla., pleaded guilty on Aug. 1, in the U.S. District Court in Miami, Fla., for attempting to unlawfully import the refrigerant CFC-12 into the United States in violation of the Clean Air Act. On May 4, Ammons and co-defendant Hugh A. Robinson attempted to smuggle approximately ninety 30-pound cylinders of CFC-12 into the United States in false compartments aboard the motor vessel Sierra. The illegal cargo was discovered when the boat was stopped and inspected by the city of Fort Lauderdale Marine Patrol Unit for running without navigation lights. The CFC-12 was to be unlawfully sold to local auto repair shops in the Palm Beach and St. Lucie County areas. The importation of CFC-12 is highly restricted, because when it is released into the environment, CFC-12 damages the earth's ozone layer which protects people from ultraviolet radiation that can cause skin cancer and cataracts. When sentenced, Ammons and Robinson, who previously pleaded guilty, each faces up to five years in prison and/or a fine up to \$250,000.

The case was investigated by EPA's Criminal Investigation Division and the U.S. Customs Service, and is being prosecuted by the U.S. Attorney's Office for the Southern District of Fla., in Miami.

3. Four Convicted in Louisiana Methyl Bromide Case That Killed Mother and Sickened Child

Amtek of La. Inc., and its president Robert Case, both of Baton Rouge, La., and Sims Brothers Construction Inc. and its site superintendent, Mark Jerkins, both of Pensacola, Fla., were convicted on July 31, in the U.S. District Court in Baton Rouge for violating the Resource Conservation and Recovery Act. In May 1997, Sims Brothers hired Amtek to demolish buildings on a construction site in Baton Rouge. During the demolition, two 200-pound cylinders marked "poison," containing the highly poisonous rodenticide methyl bromide, were found at the

site. Case and Jerkins removed the cylinders from the building and then stored them in an open area at the construction site. An Amtek employee removed the cylinders believing that they contained butane or propane and gave them to his cousin Edith Rome in Albany, La. to be stored in her home. Ms. Rome, 32 years of age, died of methyl bromide poisoning from leaky valve. Her son Christopher became seriously ill and required emergency medical treatment. The case was investigated by EPA's Criminal Investigation Division, the Louisiana Department of Agriculture with assistance from the Louisiana Department of Environmental Quality and the La. State Police. It was prosecuted by the U.S. Attorney's Office for the Middle District in Baton Rouge.

4. Modine Displays CO₂ Air-Conditioning System at SAE Automotive Alternative Refrigerant Systems Symposium

SCOTTSDALE, Ariz.--(BUSINESS WIRE)--July 10, 2000--Modine Manufacturing Company will display and demonstrate the operation of a vehicular airconditioning system that uses environmentally friendly carbon dioxide (**CO**₂) as a refrigerant. The prototype system is being introduced at the 2000 Society of Automotive Engineers (SAE) Automotive Alternate Refrigerant Systems Symposium July 11-13, 2000, at the Resort Suites Hotel in Scottsdale.

Modine installed the air-conditioning system on a BMW 328i car. ``The design goals were to demonstrate a fully functioning CO₂ vehicular air-conditioning system with equal or better performance than the existing R-134a system, a lofty goal as the BMW is known to have a very high-performance R-134a system," said Steve Memory, Manager of Heat-Transfer Research at Modine. R-134a is an interim substitute replacing CFC (chlorofluorocarbon) refrigerants, which are implicated in the destruction of the ozone layer. Modine's new heat exchangers had to be direct, drop-in replacements for the existing components, having the same size and volume.

During the Symposium, the **CO**₂-system-equipped vehicles will soak for up to an hour in the noon-day sun, reaching interior temperatures of up to 1600 Fahrenheit. After lunch, selected participants will qualitatively evaluate the cooling performance by taking the vehicles on a pre-selected course that includes idle, city, and highway driving. Certain quantitative measurements, including time to cool down, final register and head-level temperatures, and quality of air movement will also be taken.

"This Symposium gives Modine the opportunity to demonstrate not only our expertise in the development of high-performance heat exchangers, but also our ability to do complete air-conditioning system design," said Memory.

Initial testing and preparation took place at Modine's Technical Center in Racine, Wis. The two key heat exchangers in the system, the gas cooler (replacing a conventional air-conditioning condenser) and the evaporator, were tested in a split room, where the air temperature and velocity for each heat exchanger could be simulated as part of a complete system. The split-room test environment is the most realistic way to simulate actual operating conditions, because the gas cooler is installed under the hood of the vehicle while the evaporator is located under the dashboard in the passenger compartment. ``In the Racine Technical Center, we were able to quantify various heat-exchanger designs and experiment with a number of control methodologies," said Memory.

Vehicle preparation took place at Modine Climate System Division's wind tunnel and technical support facility in Harrodsburg, Ky. Employees there conducted baseline wind tunnel tests of the R-134a system before removing it from the car. Then, they installed and wind-tunnel-tested the new, **CO**₂ system. ``Initial results are very promising," said Sam Collier, manager of engineering for Modine's Climate Systems Division in Harrodsburg. ``With a few additional refinements at idle, we feel very confident we can reach and surpass the goals we set," he added.

Modine is a world leader at solving heating and cooling problems in vehicles, buildings, and off-highway and industrial equipment. With headquarters in Racine, Modine has annual sales of more than \$1 billion and has 8,300 employees worldwide.
